1. Selenium allows you to test features of a webdev project in your browser—This is great because you can actually check your project visually yourself before making Selenium confirm things that are a bit more subtle.
2. From my initial impression, it seems that whatever you're testing needs to already be live somewhere before you can test it—maybe not feasible/a good idea.
3. <tr><td>MyCase</td></tr>
4. <tr><td>click</td> <td>//a[@id='myLink']/</td> <td></td></tr>
5. HTML is a widely known language that pretty much every web developer should know, allowing Selenium to be easy to pick up for people who haven't used it before. That being said, it also limits Selenium in specific ways it can test.\
